

ABSTRACT OF THE DISCLOSURE

A press-on nail polish device comprises a conformable thin plastic element having an area and shape approximating the area and shape of a nail. The thin element has an adhesive of a strength to firmly hold the element to a nail, but to enable the element to be peeled away from a nail when desired. A kit comprises a plurality of the thin elements in contact with one release backing. A plurality of the release backings can be provided along with an emery board, orange stick and alcohol wipes.
